

# Article Stress-strain behavior of sand at high strain rates (Mehdi Omidvar et al,2012)

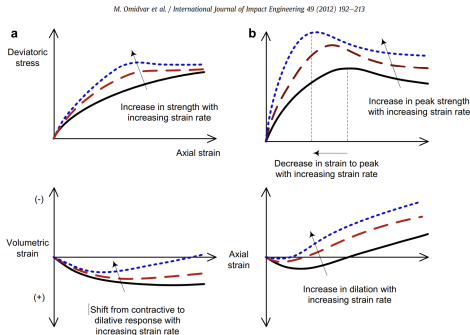

Fig. 19. Effect of increase in strain rate on stress-strain response and volumetric strains in (a) loose sand, (b) dense sand [interpreted based on data from Table 3].

"Under HSR loading, there is not enough time for strain energy accumulation, which prohibits crushing and promotes rolling-rearrangement resulting in a higher resistance to shear"

# Trouver le régime de l'état critique

Figure 1 – Déformation Volumique

$$\begin{aligned} \text{hpd} : \varepsilon_{yy} &= \frac{\Delta h_{yy}}{h_{yy}^0}; \varepsilon_v = \varepsilon_{xx} + \varepsilon_{yy} + \varepsilon_{zz} \\ \text{gd} : \varepsilon_{yy} &= \ln \left( \frac{h_{yy}}{h_{yy}^0} \right); \varepsilon_v = \frac{\Delta V}{V_0}; \end{aligned}$$

Figure 2 – Nombre de Coordination

$$Z = \frac{2N_{\text{contact}}}{N_{\text{particule}}}; I = \frac{v}{H_0} \sqrt{\frac{m}{Pa}}$$

# Paramètres principaux

Symbole	Paramètre	Valeur
$L$	Longueur	3 m
$H$	Hauteur	1 m
$\rho$	Densité	2700 kg/m <sup>3</sup>
$E$	Module de Young	$1 \times 10^9$ Pa
$\nu$	Coefficient de Poisson	0.2
$\varphi$	Angle de frottement	25°
$\psi$	Angle de dilatance	$\approx 0^\circ$
$v$	Vélocité de déplacement	0.005 m/s
$c$	Cohésion	0 & 100 Pa

Table 1 – Paramètres du modèle Mohr-Coulomb

# État Rankine - Théorie

Coefficient  $K$  : la relation entre la contrainte verticale et horizontal :

- Poussée active :  $K_a = \frac{1 - \sin(\varphi)}{1 + \sin(\varphi)} = 0.406$
- Poussée passive :  $K_p = 1/K_a = 2.464$
- État au repos :  $K_0 = 1 - \sin(\varphi) = 0.577$

La somme de pression  $F$ (kN) appliqué sur le mur :

Sans cohésif :

$$F_a = \frac{1}{2} \gamma H^2 K_a = 5.376861$$

$$F_p = \frac{1}{2} \gamma H^2 K_p = 32.619458$$

$$F_0 = \frac{1}{2} \gamma H^2 K_0 = 7.647$$

Cohésif :

$$F_a = \frac{1}{2} \gamma H^2 K_a - 2cH \sqrt{K_a} = 5.249425$$

$$F_p = \frac{1}{2} \gamma H^2 K_p + 2cH \sqrt{K_p} = 32.93334$$

$$F_0 = \frac{1}{2} \gamma H^2 K_p + 2cH \sqrt{K_0} = 7.495$$
